Abstracts

The global Wood Sander market size is predicted to grow from US\$ 909 million in 2025 to US\$ 1300 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2025, global Wood Sander production reached approximately 0.12 M Units. Prices range from several hundred to tens of thousands of dollars. A wood sander is a mechanical device used to sand, level, thicken, refine, and texture the surface of wood or wood-based materials. It uses abrasive media such as sanding belts, sanding discs, or brush rollers, under certain pressure and motion (such as linear feed or rotary motion), to remove material or modify the surface of the workpiece, thereby achieving dimensional accuracy control and surface quality improvement.

Gross Profit Margin Level

The gross profit margin of the wood sander industry is typically significantly lower than that of software and high-value-added electronic products, and closer to the profit characteristics of mid-to-high-end specialized equipment manufacturing. The industry's costs mainly come from steel structural components, machined parts, main drive systems, sanding frames/pressure pads/control systems, electrical components, assembly and debugging, and distribution channels and after-sales service. Public financial data shows that in 2025, HOMAG's D?rr woodworking machinery business had sales revenue of ?1.3715 billion and a gross profit of ?384.1 million, corresponding to a gross profit margin of approximately 28.0%, while the EBIT margin before extraordinary effects was 5.5%; Biesse's adjusted EBITDA margin in 2025 was 5.8%. Based on this, a gross profit margin of approximately 22%-35% for the overall wood sander industry is reasonable: standard, highly competitive single-machine products typically have lower margins, while highly automated equipment with multiple sanding frames and targeting high-end furniture and complete production line customers has relatively higher gross

profit margins. Overall, the wood sanding machine industry belongs to the equipment sector with moderate gross profit margins but high requirements for manufacturing capabilities, reliability, and service systems.

Industry Drivers The growth of the wood sanding machine industry is mainly driven by four factors. First, the continued demand from furniture, customized home furnishings, wooden doors and flooring, and engineered wood processing provides a stable downstream base for sanding equipment. Second, surface quality requirements are constantly increasing, especially in pre- and post-coating processes, edge banding, irregular part processing, and high-end decorative surface processing, where sanding precision, stability, and consistency are becoming increasingly critical. Third, automation and continuous production upgrades are replacing traditional manual sanding, and companies hope to improve yield, cycle time, and labor efficiency through wide-band sanders, brush sanders, and inline systems. Fourth, the overall woodworking machinery market is steadily expanding, also driving the synchronous growth of sanding machines, a core downstream equipment. Research institutions have given positive growth forecasts for both the woodworking machinery and wood sanding machine markets, and leading companies' official websites generally emphasize automation, surface treatment quality, and multi-scenario adaptability, indicating that the industry is moving from ?single-machine processing tools? to ?surface treatment solution equipment.?
