Wood Torsion Tester is a testing instrument used to measure torsional strength, deformation, shear behavior, and mechanical stability of wood, engineered wood, bamboo materials, furniture components, and structural timber. It supports quality control, product development, standards testing, material comparison, and safety evaluation in wood processing and research environments.

The industrial chain of Wood Torsion Testers covers upstream load cells, torque sensors, motors, frames, fixtures, controllers, displays, software, bearings, and calibration tools. The midstream consists of mechanical design, sensor integration, fixture machining, control programming, calibration, accuracy testing, safety testing, and packaging. Downstream applications mainly include wood product manufacturers, furniture factories, laboratories, inspection agencies, universities, construction material testing, and forestry research.

Timber processing, furniture manufacturing and wood material R&D promote popularization of wood torsion testers. Accurate torque measurement verifies wood mechanical properties for raw material quality screening. High-precision sensor configuration improves testing data accuracy.
