The wort aeration system is a key equipment in the beer brewing process. It is used to inject sterile air or oxygen (usually 8-12 ppm dissolved oxygen) into the cooled wort before fermentation to promote yeast proliferation and fermentation activity. The system consists of a gas regulation module (to control O₂ concentration), an online dissolved oxygen detector and a high-efficiency diffuser (ceramic/stainless steel aeration head) to ensure that oxygen is evenly dissolved and avoid contamination. The core technology is to balance the oxidation reaction (affecting flavor) with the oxygen demand of yeast. It is widely used in craft breweries and large-scale industrial brewing production lines.
