The global Wound Cartridge Filter market size is predicted to grow from US\$ 580 million in 2025 to US\$ 682 million in 2032; it is expected to grow at a CAGR of 2.4% from 2026 to 2032.

In 2024, the global production of wound cartridge filters was 850 million units, with an average price of US\$0.68 per unit.

A wound cartridge filter is a deep filtration element made by precisely winding textile fibers (such as polypropylene, degreased cotton, or glass fiber) onto a porous framework (such as polypropylene or stainless steel). Utilizing a honeycomb structure with a loose outer layer and a dense inner layer, it effectively removes suspended solids, particles, rust, and other impurities from liquids. By controlling the winding density and yarn thickness, the filtration precision can be adjusted, and it features a large dirt-holding capacity, low pressure drop, and high filtration efficiency.

The upstream of the wound cartridge filter industry chain mainly consists of suppliers of basic materials such as polypropylene fiber, cotton fiber, glass fiber, and stainless steel skeleton. These materials determine the filter cartridge's temperature resistance, corrosion resistance, and pore structure stability. Downstream applications are very extensive and are the core of industry value realization, including food and beverage, pharmaceuticals, daily chemicals, electronics, power, petrochemicals, water treatment, and seawater desalination, with industrial water treatment, food and beverage, and pharmaceutical industries having the strongest demand. Industrial water treatment uses large quantities, typically for boiler feedwater, circulating cooling water pretreatment, and pre-filtration in RO systems, significantly reducing downstream membrane fouling and replacement frequency. The food and beverage industry relies on wound filter

cartridges for pre-filtration of liquids such as syrups, drinking water, and plant protein drinks, requiring safe materials that do not leach out. The pharmaceutical industry uses wound filter cartridges in the pretreatment of raw materials, water for injection, and fermentation broths, improving continuous system efficiency through stable pore structure and high contaminant carrying capacity. Therefore, downstream demand has stable consumption and a high replacement cycle, constituting the main driver of industry growth.

The industry trend is towards higher precision, longer lifespan, and multi-material composites. Traditional PP wound filter cartridges are gradually upgrading to high-density winding, gradient structures, and high-temperature resistant materials to meet the higher cleanliness requirements of industries such as electronics and pharmaceuticals. Driving factors mainly include the global growth in industrial water treatment scale, increased penetration of RO membrane systems, strengthened food safety regulations, expanded demand for filtration consumables due to continued expansion in the pharmaceutical industry, and the replacement of traditional filters with high-performance materials driven by green manufacturing trends. Obstacles include high product homogenization, overcapacity in the low-end market, intense price competition, replacement of some applications by melt-blown or pleated filter cartridges, and increasing customer demand for improved filtration precision and stability, putting pressure on some low-end companies to upgrade their technology.

The annual output of a single production line is approximately 350,000 to 500,000 units, with gross profit margins generally between 18% and 28%.
