Wound debridement machines are used to remove dead and necrotic tissues from wounds in order to speed up the healing process. Ultrasound-based devices, larval therapy, and mechanical pad devices are debridement devices. Wound debridement machines can be accomplished in a variety of ways, including autolytic, enzymatic, surgical, and other methods. Wound debridement devices are becoming more popular because they remove dead and decaying tissues and enhance blood circulation in the affected area, lowering the risk of infection.
