The global X-ray CMOS Image Sensor market size is predicted to grow from US$ 1392 million in 2025 to US$ 2077 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

In 2025, global X-ray CMOS Image Sensor production reached approximately 309 million Units, with an average global market price of around US$ 4.6 per unit.

An X-ray CMOS Image Sensor is a semiconductor device that converts X-ray photons into digital signals for high - resolution, low - noise imaging, widely used in medical, industrial, security, and scientific fields, and is gradually replacing traditional amorphous silicon (aSi) and CCD detectors. It mainly uses two detection methods: indirect conversion (X - ray ? scintillator ? visible light ? CMOS photodiode) and direct conversion (X - ray ? semiconductor electron - hole pairs ? electrical signal), with pixel - level amplification and fast readout as its core advantages.

The CMOS image sensor industry chain presents a vertical hierarchical structure with clear division of labor, spanning from upstream core material and equipment supply, midstream sensor design, manufacturing and packaging, to downstream application terminal integration. The industry has strong technical barriers, high concentration of leading enterprises, and close collaborative links between upstream and downstream links. The upstream segment provides the essential materials, equipment and intellectual property (IP) required for CIS design and manufacturing, and is the foundation of the entire industry chain. The market is dominated by a small number of international enterprises. The midstream is the core value link of the industry chain, covering three key links: chip design, wafer fabrication, and packaging and testing. The industry is divided into two business models: IDM (Integrated Device Manufacturer) and

Fabless + Foundry + OSAT. Downstream applications cover consumer electronics, automotive electronics, industrial detection, security monitoring, medical imaging and other fields. The demand of different scenarios drives the iteration of CIS technology, and the B2B field has become the main growth engine in recent years. The iteration of downstream application demand (e.g., automotive high dynamic range, industrial global shutter) drives the R&D of midstream design and upstream material and equipment technologies, forming a positive feedback loop.
