X-ray Detection of Foreign Bodies use X-rays (light waves the eye can't see) to locate contaminants. Some systems can even detect down to 0.8 mm in size — and, in some cases, even smaller. X-ray inspection machines work by safely passing low-energy X-rays into the product as it passes through a detector. Each item can absorb different degrees of X-ray energy, including the possible foreign contaminant hidden inside. The

higher an object's density, the harder it is for X-rays to pass through it. X-ray machines detect foreign objects because they tend to absorb more rays compared with the "normal" non-contaminated areas surrounding them.
