The global X-ray Foreign Body Detection Machine market size is predicted to grow from US\$ 369 million in 2025 to US\$ 603 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

X-ray foreign object detection machine is a device that uses X-ray technology to detect and identify foreign objects in products or materials. These foreign objects may be materials such as metal, glass, plastic, wood chips, stones, etc. that do not meet product specifications, and are usually used for quality control in fields such as food and medicine. In 2024, global X-ray Foreign Body Detection Machine production reached approximately 7,458 units, with an average global market price of around K US\$ 47.06 per unit. The annual production capacity of a single production line is 1,000 units, with a gross profit margin of about 40%. Upstream raw materials: X-ray tubes, X-ray detectors/flat panel detectors, high-voltage power supplies, cables, connectors and wire harnesses, conveyor components, etc.

Raw material cost is 55%–65%; manufacturing cost is about 10%–15%; labor cost is about 8%–12%.

X-ray detection technology can detect various physical pollutants, including metals, bones, stones, glass, plastics, and rubber compounds. It can also perform a series of product quality and integrity checks, from detecting damaged or missing components to inspecting products inside sealed packaging. X-ray detection technology helps prevent contaminated or low-quality products from reaching consumers and avoiding product recalls. A recall can have a catastrophic impact on consumer trust, requiring retailers and their suppliers to spend millions of dollars to correct it, and sometimes causing irreparable damage to brand reputation.
