X-rays use ionizing radiations to generate images of organs in the body. The patient is exposed to an X-ray beam where the x-rays are absorbed or scattered by the internal structures and the remaining are passed to the detector, which processes the image. Hands are an important part of the body and their exposure to the X-ray beam should be limited. X-ray gloves are used to constrict and disable the scattered radiation in the benefit of the healthcare providers who are continuously exposed to X-rays.
