The global XBC Curved Solar Tile market size is predicted to grow from US$ 25.48 million in 2025 to US$ 1008 million in 2032; it is expected to grow at a CAGR of 70.5% from 2026 to 2032.

Photovoltaic tiles are a kind of building material integrated product that deeply integrates amorphous silicon photovoltaic modules with building roofing materials. They can directly replace traditional roofing tiles and maintain the same installation method. Its product features are mainly reflected in the convenience of installation, thermal insulation, power generation efficiency, and excellent low-temperature impact resistance and corrosion resistance. Among them, XBC curved photovoltaic tiles use advanced XBC battery technology, and the curved structure design improves the coordination between the product and the architectural style. It is a typical application of photovoltaic building integration (BIPV) technology. XBC curved photovoltaic tiles are divided into P-IBC and N-IBC according to the substrate type. They use p-type and n-type back electrodes on the back of the battery respectively, and both use staggered electrodes to improve current collection efficiency. P-IBC technology is similar to N-IBC, but uses p-type back electrodes on the back of the battery, and also improves current collection efficiency by staggered electrodes. N-IBC technology uses n-type back electrodes on the back of the battery, and improves current collection efficiency through staggered electrode structure. This structure reduces the metal coverage on the front surface of the battery and increases light absorption.
