The global XRT Ore Sorting Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An XRT (X-ray Transmission) Ore Sorting Machine is an advanced industrial device used in the mining industry to separate valuable ore from waste material based on their density differences. Utilizing X-ray technology, the machine scans and analyzes the composition of ore particles as they pass through the system. It identifies and sorts out high-density valuable minerals from low-density waste rock, enabling efficient and precise ore sorting. This technology enhances ore quality, reduces processing costs, and minimizes environmental impact by ensuring that only high-grade material is processed further. XRT ore sorting is particularly beneficial for operations seeking to improve resource efficiency and overall productivity.
