The YAG family of crystals refers to a group of laser crystals that share a common host material, which is YAG (Yttrium Aluminum Garnet). These crystals are doped with different rare-earth or transition metal ions to achieve specific laser emission wavelengths and properties. The YAG family of crystals is widely used in solid-state lasers due to their excellent thermal, mechanical, and optical properties.

These YAG family crystals are chosen based on their specific emission wavelengths and other characteristics to suit various applications in medical, industrial, scientific, and military fields. The YAG host material provides the lattice structure and mechanical stability necessary for incorporating the dopant ions, which, in turn, determine the laser's emission properties and efficiency.
