In spinning process yarn conditioning machine is used to adjust the moisture of yarn and to improve efficiency in the next process. After processing, when the moisture level of yarn would reach about 8.5 %, strength and elongation can be increased greatly, which help the performance at processing line. The dealing of cone yarn would improve the efficiency on winding, doubling and twisting and also reduce the yarn hairiness. It will be also helpful to improve warping efficiency and to reduce the defects from rewinding and warping. Owing to the conformity of moisture of the yarn, the efficiency of sizing and weaving will also improved ensuring the quality of the final fabric.

The yarns after processing by yarn conditioning machine would improve the working process as well as the quality of final fabric. Because of fixed twisting and shaping of the yarn, it will give equal height of rising and looping, reduce the unwinding tension, stable the structure and size of the end fabric and give better appearance. Especially it is the key process for setting the seamless underclothes. The process of conditioning will not only stabilize the twist, but also fully relax the yarn to reduce the shrinkage of final product.

In dyeing industry, processing after yarn conditioning machine can remove the stress on grey fabric, which will be helpful for uniform absorption of dyes to obtain bright color as well as uniform shade of the fabric. In garment industry, yarn conditioning machine can make fabric with stable size, reducing the shrinkage and improving the quality.

Processing yarn, especially the chemical fiber, in the conditioning machine can greatly improve the quality and appreciation of product.

The global Yarn Conditioning Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
