Yarn quality inspection systems are automated inspection devices for the textile industry, primarily used for real-time detection and quality analysis of key indicators such as yarn uniformity, breakage rate, impurity content, twist, wet strength, and hairiness. These systems typically consist of high-precision sensors, image acquisition units, tension control devices, data acquisition and processing modules, automatic rejection or sorting mechanisms, and upper-level monitoring software, enabling online continuous monitoring, automatic alarms, and production data recording. Yarn quality inspection systems are widely used in spinning mills, knitting mills, weaving mills, and functional yarn production lines, effectively improving product consistency, reducing defect rates, increasing production efficiency, and providing accurate data support for subsequent weaving and dyeing processes. With the development of smart textiles, Industry 4.0, and digital factories, these systems are upgrading towards multi-parameter integration, AI intelligent analysis, and high-speed online detection. Future demand is expected to continue to grow in high-end yarn, functional yarn, and export-oriented textile enterprises, presenting a vast market opportunity.
