A yarn twist meter, also known as a twist tester or twist analyzer, is a device used to measure the twist or the number of twists per unit length in a yarn or thread. Twist is an important characteristic of a yarn as it determines its strength, appearance, and performance in various textile applications. The yarn twist meter typically consists of a rotating spindle or clamp that holds the sample yarn or thread. The yarn is clamped securely at one end while the other end is attached to a weight or tensioning mechanism. The device measures the rotation or the number of turns required for a certain length of yarn to untwist under a known tension. The twist meter may have a mechanical or electronic mechanism to accurately record and display the twist measurement. It can provide results in various units, such as twists per inch (TPI), twists per meter (TPM), or turns per centimeter (TPC). Some advanced twist meters may also provide additional information, such as twist direction (S- or Z-twist) and twist angle. The twist measurement obtained from a twist meter helps assess the quality,

consistency, and performance of the yarn. It is particularly important in industries such as textile manufacturing, where the desired twist level needs to be maintained to achieve the desired fabric characteristics. By measuring twist, manufacturers can ensure that the yarn meets specific standards and requirements for different applications, such as sewing, weaving, knitting, or embroidery. Additionally, twist meters are valuable tools in quality control and research and development processes within the textile industry.
