The global Yeast two-hybrid System market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The yeast two-hybrid (Y2H) system is a powerful molecular biology technique used to study protein-protein interactions (PPIs) in a controlled laboratory setting. It was developed to identify and analyze interactions between proteins and has become a fundamental tool for understanding the functions of proteins and their roles in various biological processes. The Y2H system takes advantage of the molecular biology and genetic properties of the yeast Saccharomyces cerevisiae to detect and characterize PPIs.

Researchers were developing more advanced screening strategies within the Y2H framework to enhance the sensitivity and specificity of interaction detection. These strategies include using different yeast strains, reporter genes, and selection markers.
