Abstracts

The global Yttrium Orthovanadate market size is predicted to grow from US\$ 156 million in 2025 to US\$ 240 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

YVO₄ is a positive uniaxial birefringent single crystal grown using the Czochralski (vertical pulling) method. It has a zircon-type tetragonal crystal structure and is characterised by high birefringence, a broad transmission bandwidth (approximately 0.4-5 μm), non-deliqescence, and good mechanical properties. Consequently, within the optical industry, it is not primarily utilised as a bulk functional ceramic, but rather as a high-performance optical crystal within the polarisation-splitting device and solid-state laser supply chains.

From an industrial perspective, YVO₄ is effectively divided into two main categories:

One is undoped YVO₄, whose core value lies in its high birefringence, and which is used in isolators, circulators, beam shifters, polarizers, and similar devices; The other is Nd:YVO₄ (neodymium-doped yttrium vanadate), which serves as the gain medium for diode-pumped solid-state (DPSS) lasers, primarily catering to 1064 nm / 1342 nm near-infrared applications and their second-harmonic green, blue and UV light sources for compact laser systems.

Global YVO₄ sales volume is projected to reach 166,830 pieces in 2025, with an average price of US\$956.31 per piece

Development Trends

China accounts for 68% of global production capacity, with leading companies such as Fuchun Technology matching international standards in technology; the target self-sufficiency rate for 2028 is 90%+.

Large-size (80-100 mm) crystals with high homogeneity have entered mass production, breaking the overseas monopoly.

Dual-drive model of lasers and optical communications

Industrial Laser Upgrades: Nd:YVO₄ is being fully adopted in low-to-medium power DPSSLs, replacing Nd:YAG, with an annual growth rate of **+12-15%**

Optical Communications Expansion: 800G/1.6T optical modules are driving demand for pure YVO₄ isolators, with an annual growth rate of **+8-10%**

Technological Iteration: Higher Power, Greater Integration

Highly doped Nd:YVO₄ (3 at%+): Enhances gain and reduces size, suitable for micro-lasers

Thin-film / Wafer-scale: YVO₄ thin films for silicon photonics integration, reducing component costs

Co-doping technology: Nd:Yb:YVO₄, enabling wide-band tunable lasers

Expansion into emerging fields

Quantum information: High-purity YVO₄ for quantum key distribution and optical frequency combs

LiDAR: High-damage-threshold YVO₄ for solid-state LiDAR light sources

Medical aesthetics: Green/blue Nd:YVO₄ lasers for skin treatment and hair removal
