Zeeman dual-frequency laser interferometer, by applying an axial magnetic field to the laser (usually a helium-neon laser), uses the Zeeman effect to make the laser output two slightly different frequencies (usually a few megahertz) of left-handed and right-handed circularly polarized light. These two beams undergo a series of optical processing (such as conversion into mutually perpendicular linear polarized light after passing through a 1/4 wave plate), and then are used as reference light and measurement light respectively. When the optical path of the measurement light changes (such as the movement of the reflector), the Doppler effect will occur, causing the frequency of the measurement light to change, and this change is proportional to the displacement of the reflector. By measuring this frequency change, the displacement of the reflector can be accurately calculated. Zeeman dual-frequency laser interferometer is widely used in various high-precision measurement fields, such as calibrating the coordinate accuracy of length measuring machines, three-coordinate measuring machines, lithography machines and machining centers, as well as high-precision straightness measurement, flatness measurement and small angle measurement.

The global Zeeman Dual-frequency Laser Interferometer market size is projected to grow from US\$ 171 million in 2024 to US\$ 217 million in 2030; it is expected to grow at a CAGR of 4.0% from 2024 to 2030.
