The global Zero-emission Autonomous Vessel market size is predicted to grow from US\$ 8250 million in 2025 to US\$ 14151 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

Zero-emission Autonomous Vessel design is an innovative approach in maritime engineering that focuses on creating vessels capable of operating without human intervention while producing no greenhouse gas emissions. This cutting-edge field combines advanced technologies in automation, renewable energy, and sustainable engineering to develop ships that are environmentally friendly and capable of autonomous navigation.

Zero-emission Autonomous Vessels will develop toward clean propulsion, higher-level autonomous navigation, remote operation, and smart port integration. As emission reduction requirements in the shipping industry become stricter, battery power, hydrogen fuel cells, green methanol, ammonia fuel, and hybrid propulsion systems will be increasingly used in ferries, inland vessels, port service ships, and short-sea cargo vessels. At the same time, ships will integrate radar, cameras, LiDAR, satellite navigation, automatic collision avoidance algorithms, and AI decision-making systems, gradually moving from assisted navigation to highly autonomous operation. Future development will focus not only on zero-emission propulsion and vessel intelligence, but also on coordination with shore control centers, smart ports, clean fuel bunkering infrastructure, and fleet management platforms to improve safety, reduce labor costs, and support greener and smarter shipping systems.
