Abstracts

The global Zero Emissions Electric Tugboat market size is predicted to grow from US$ 874 million in 2025 to US$ 3449 million in 2032; it is expected to grow at a CAGR of 22.1% from 2026 to 2032.

In 2024, the global market for zero emissions electric tugboats saw approximately 28 new constructions and deliveries, with an average unit price of approximately US$26.3 million per vessel and an industry gross margin of approximately 18% to 26%. Zero emissions electric tugboats are zero-emission port motorized vessels that use high-capacity marine lithium batteries (or lithium-titanium batteries/lithium iron phosphate/solid-state battery plans) as the sole or primary power source, and achieve berthing, unberthing, turning, and emergency maneuvering operations through electric propellers, Z-type rudder propellers, or stern-mounted twin propellers, core cost of a fully electric tugboat consists of the electrical system, battery pack, propulsion motor, power electronics, hull structural steel, and high-grade marine cables. Raw material costs account for approximately 62%–71% of the total vessel cost. Typical rated thrust range is 50–90 tons, continuous power is 1.6–4.5 MW, battery capacity is 2–7 MWh (some ports use shore power + battery swapping stations to extend operating time), and endurance is generally 3–5 hours, which can meet the needs of short-distance, high-frequency missions in ports. To adapt to multi-condition operation in port areas, all-electric tugboats are usually equipped with redundant power distribution busbars, thermal management systems, shore-based intelligent charging interfaces and power control collaborative algorithms. Some leading ports, such as Rotterdam, Los Angeles, and Shenzhen Mawan Port, can form a unified scheduling system of shore power DC busbars to achieve scheduling of day and night operations. Sanmar Shipyards delivered approximately 2 fully electric tugboats annually, mainly serving near-shore ports in Turkey and the Middle East.
