The global Zero Flux Current Transformer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A zero flux current transformer is a device used to detect the current value called the zero phase current in a three-phase AC power supply. The sum of the vectors of the currents flowing in each phase of a three-phase AC power supply is normally symmetrical and thus zero, but when a ground fault current flows, the balance is disturbed and a non-zero value is obtained.

In the event of a ground fault, a zero flux current transformer is activated to immediately disconnect the fault location from the surrounding electrical circuit. For this reason, they are built into RCDs in advance and constantly play a role in detecting accidents.

United States market for Zero Flux Current Transformer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
