The global Zero Phase Reactor market size is predicted to grow from US\$ 343 million in 2025 to US\$ 498 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

A zero-phase reactor is a type of reactor used as a peripheral device of an inverter. The reactor has a structure of coiled electric wire and is installed on the input or output side of the inverter to block high-frequency currents and reduce noise. While a general reactor consists of a single wire wound like a choke coil, a zero-phase reactor consists of three phases of wire wound with equal polarity and number of turns. The zero-phase reactor reduces the noise generated when the inverter is operated.

Zero-phase reactors are installed on the input and output sides of inverters to reduce the impact of noise generated by the inverter on peripheral equipment. Inverters are used in a wide variety of fields, including household air conditioners, refrigerators, rice cookers, industrial motors and pumps, elevators, and medical electronic equipment. Zero-phase reactors, which are peripheral devices of inverters, are also widely used.

United States market for Zero Phase Reactor is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
