The global Zero Phase Shift Mirrors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

In conventional mirrors, the polarization type of the incident light beam changes during reflection. For example, s-polarized light becomes p-polarized light. A zero phase shift mirror ensures that the polarization type of the incident light beam remains unchanged. It can be used, for example, in laser material processing to guide the laser beam from the source to the cutting head.

United States market for Zero Phase Shift Mirrors is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
