Zero Trust Architecture software is a security framework designed to improve cybersecurity and protect an organization's data and assets. Zero Trust Architecture software is based on a simple idea: Trust no one or device, even internal users or devices. Traditional network security methods usually rely on perimeter defense, that is, setting up firewalls and security policies at the boundaries of the network to protect internal resources. However, as cyberattacks become increasingly sophisticated and stealthy, this traditional approach is no longer sufficient. Zero-trust architecture software implements a 'zero-trust-based' security model by limiting network access permissions to a minimum. This means that users and devices must be authenticated and authorized to access network resources, whether on the internal or external network. Zero trust architecture software typically includes a variety of security features, such as multi-factor authentication, access control, network monitoring and behavioral analysis, to ensure network security and data protection.

The global Zero Trust Architecture Software market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
