The zinc phosphate conversion coating process used today converts the metal surface into a non-metallic, polycrystalline coating containing iron, manganese, nickel, and zinc phosphates. Since the zinc phosphate pretreatment process converts the metal surface, the coating provides an excellent base for paint adhesion. As zinc phosphate conversion coatings incorporate additional metal ions into the coating to increase the alkaline resistance, it makes an excellent paint base offering superior adhesion and durability.

The global Zinc Phosphate Conversion Coating market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
