The global Zinc-rich Coatings market size is predicted to grow from US\$ 5084 million in 2025 to US\$ 7041 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Zinc-rich coatings is an anti-corrosion coating with zinc powder as the main anti-rust pigment. The paint film is steel gray and has a smooth, matte surface. It has strong adhesion and salt water resistance. The surface drying time is 2 hours and the complete drying time is 24 hours.

In 2025, the global production of zinc-rich coatings is estimated at 1.35 million tons, with an average price of US\$3,850 per ton and an average gross profit margin of 24%.

Based on our research, zinc-rich coatings are among the most important functional primers in heavy-duty anticorrosive coating systems. Their value does not lie in color or decorative appearance, but in the sacrificial cathodic protection provided by high levels of metallic zinc dust. Compared with conventional anticorrosive primers, zinc-rich coatings require stricter surface preparation, controlled zinc content in the dry film, zinc particle dispersion, suitable organic or inorganic binder chemistry, coating conductivity and compatibility with subsequent intermediate and topcoat systems. They are typically used in medium to severe corrosive environments for steel protection. AkzoNobel's Interzinc 22 data sheet states that the coating contains at least 85% zinc dust by weight in the dry film and can be used for bridges, tanks, pipelines, offshore equipment and structural steel. Sherwin-Williams China also lists zinc-rich coatings across inorganic zinc primers, zinc-rich epoxy primers and moisture-cured polyurethane zinc primers, confirming the engineering and standards-driven nature of the category.

From the supply side, the global market is composed of multinational protective coating groups, marine and offshore coating specialists, regional industrial coating companies

and local heavy-duty coating manufacturers in China and other emerging markets. AkzoNobel, PPG, Sherwin-Williams, Jotun, Hempel, Nippon Paint, Kansai Paint, Chugoku Marine Paints and KCC have strong customer bases and system-level coating capabilities in marine, offshore, bridge, oil and gas, energy and industrial steel applications. Carboline, Sika, Axalta and Tnemec are more specialized in protective and industrial project coatings. Regional players in India, Southeast Asia, Taiwan and China are supported by local demand from infrastructure, shipbuilding, ports, petrochemicals and structural steel. KCC's offshore coating system lists epoxy zinc-rich primer and inorganic zinc silicate products, while TOA-Chugoku Paints in Thailand lists EPICON Zinc Rich Primer B-2, showing that Japan, Korea and Southeast Asia are also important parts of the global supply base.

Demand for zinc-rich coatings is closely linked to steel corrosion protection in infrastructure, offshore engineering, energy facilities, bridges, ports, ships, wind power, storage tanks, pipelines and petrochemical plants. New construction projects drive demand for inorganic zinc primers, shop primers and complete high-performance coating systems, while maintenance and repair work supports epoxy zinc-rich primers, moisture-cured zinc primers and field repair coatings. The aging of global steel infrastructure, expansion of offshore wind and port equipment, and continued maintenance of bridges and pipelines support stable long-term demand. However, this is not a high-explosive-growth market; growth is more likely to come from higher anticorrosion standards, longer maintenance cycles, lower-VOC reformulation, waterborne development, offshore applications and renewable-energy infrastructure. Hempel's Zinc Rich Epoxy Primer 174CN is described as providing cathodic protection for local mechanical damage, while Sika Zinc Rich-1 is positioned as an anticorrosive primer for prepared metal surfaces in industrial and marine areas, reflecting the ongoing importance of maintenance and heavy-duty protection.

From a product roadmap perspective, zinc-rich coatings are evolving from traditional solvent-borne, high-VOC systems toward higher-solids, lower-VOC, waterborne, application-friendly and long-life coating systems. Epoxy zinc-rich primers remain the most widely used product type because of their broad applicability, while inorganic zinc-rich primers have advantages in high-temperature, weathering and long-durability protective systems. Zinc-rich shop primers continue to serve shipbuilding and structural steel pre-treatment processes. Future competition will not be determined only by zinc loading. It will increasingly depend on zinc utilization efficiency, coating conductivity, application tolerance, recoat compatibility, VOC compliance, salt-spray resistance, ISO 12944 and SSPC alignment, and the ability to design complete anticorrosive coating systems. Because zinc dust price volatility directly affects costs, companies with

formulation optimization, global sourcing, regional manufacturing and engineering service capabilities will be better positioned in major bridge, offshore, shipbuilding, petrochemical and energy projects.
