The global Zirconia Flue Gas Analyzers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The zirconia flue gas analyzer consists of a control unit and a sensor made of ceramic zirconia, where the zirconia is stabilized with yttria to form a lattice structure. At high temperatures, the lattice allows negatively charged oxygen ions to pass through, which are formed on the catalytic electrode. The rate of their passage is determined by the temperature and the difference in oxygen partial pressure between the sample gas and the reference gas. This device monitors the oxygen level during the combustion process at the site by measuring the sum of oxygen and unburned molecules (CO_e) in the flue gas, which is used to assess combustion efficiency and save fuel. This monitoring method is suitable for high-temperature measurements and does not require sampling extraction equipment.

United States market for Zirconia Flue Gas Analyzers is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
