The global Zirconia Polishing Powder market size is predicted to grow from US\$ 161 million in 2025 to US\$ 235 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Zirconium oxide polishing powder is an inorganic abrasive and polishing material based primarily on zirconium dioxide. It is produced through processes such as calcination, fusion, crushing, classification, particle-size control, phase control and surface modification. The material is used for grinding, polishing and surface finishing of optical glass, ophthalmic lenses, precision glass, ceramics, metals, stone, gemstones, electronic materials and specialty thin films. Its value lies in the hardness, chemical stability, controlled particle morphology and particle-size distribution of zirconia, which enable material removal and surface-quality improvement. Key performance indicators include purity, particle size, particle-size distribution, crystal phase, agglomeration level, dispersibility, scratch control, polishing rate and slurry stability.

Zirconium oxide polishing powder is a functional inorganic powder within the precision grinding and polishing materials industry. Its value is not determined by hardness alone, but by the combined control of particle size, crystal phase, particle morphology, dispersibility and scratch performance. Compared with cerium oxide polishing powder, zirconia can offer stronger cutting and wear characteristics in selected hard materials, ceramics, stone and specialty thin-film polishing applications. Compared with alumina, it provides a different balance between removal rate and surface quality in certain precision finishing processes. Compared with silica-based CMP abrasives, zirconia is more often used in selected hard-material or high-removal-rate applications. The appropriate market scope should therefore focus on zirconia powders used for polishing, rather than all zirconia ceramic powders or the broader polishing powder

market. From a demand perspective, traditional applications include precision glass, ophthalmic lenses, ceramics, metals and stone polishing, while emerging uses are found in electronic ceramics, hard thin films, carbon films, semiconductor research and high-performance composite polishing slurries. Large-volume traditional applications emphasize cost, stable supply and basic polishing efficiency. Higher-end applications place more emphasis on particle-size distribution, impurity control, low scratch generation, slurry dispersion stability and batch-to-batch consistency. As optical components, precision ceramics, electronic materials and specialty thin films require better surface quality, submicron, nano and surface-modified zirconia polishing powders may account for a higher value share, although the market will continue to face competition from cerium oxide, alumina, silica and diamond abrasives. From a supply-side perspective, the global supplier base includes international zirconia and polishing materials companies such as Saint-Gobain ZirPro, FUJIMI, Universal Photonics, Tosoh and Daichi Kigenso, as well as many Chinese zirconia powder and polishing-material suppliers. High-end competition depends on powder purity, particle-size control, dispersion systems and customer formula qualification, while lower-end applications are more price-sensitive. Future competition will focus on high-purity powders, narrow particle-size distribution, low-scratch performance, slurry compatibility, surface modification and co-development with end users.
