The global Zoom Monocular Microscope market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A zoom monocular microscope is a microscope with only one eyepiece tube and a zoom function. The zoom function is achieved through a set of continuously adjustable optical lens groups. When the zoom adjustment device is turned, the spacing and combination of the lens groups change, thereby changing the magnification of the microscope, allowing users to continuously observe samples within a certain range of magnifications. It usually has a wide magnification range, such as the common 0.7x - 4.5x, which can meet the observation needs of objects of different sizes. It can not only observe the overall situation of a large range of samples, but also magnify and observe local details when necessary. Generally, the external rotation or other convenient adjustment methods are used to change the magnification, which is simple and fast to operate. Users can adjust the magnification at any time according to actual observation needs to improve observation efficiency.
