A handheld ultrasonic cutter is a device that uses ultrasonic energy for cutting. It converts electrical energy into high-frequency mechanical vibrations through an ultrasonic generator, and then transmits these vibrations to the cutting head, using the vibration energy to produce a local heating and melting effect on the material being cut, thereby achieving the purpose of cutting. This cutting method does not require a sharp blade, nor does it require a lot of pressure on the material being cut, so it is suitable for cutting a variety of materials, especially those that are difficult to handle with traditional cutting methods, such as thermoplastic resins, carbon fiber composites, fabrics, rubber, and sticky or elastic materials. In addition, handheld ultrasonic cutters also have the advantages of neat cutting, good edge sealing, no pollution, low friction resistance, low blade wear, and long service life. They are widely used in 3D printing and model making, art, industry, design and other fields.

United States market for Handheld Ultrasonic Cutter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Handheld Ultrasonic Cutter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
