The global Harmonic Correction Unit market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A Harmonic Correction Unit (HCU) is an electrical device used to mitigate or correct harmonic distortions in electrical power systems. Harmonic distortions are unwanted and often sinusoidal waveform distortions in the voltage and current waveforms of an electrical system. These distortions are typically integer multiples of the fundamental frequency and can cause various problems, including reduced power quality, equipment overheating, increased energy consumption, and interference with sensitive electronic devices. Harmonic correction units are designed to reduce or eliminate these distortions.

Improved Power Quality: Harmonic correction units help maintain a stable voltage and current, enhancing overall power quality.

Energy Efficiency: By reducing harmonic distortions, these units can improve the energy efficiency of electrical systems, resulting in energy cost savings.

Extended Equipment Life: Mitigating harmonics can extend the lifespan of electrical equipment and prevent overheating.

Compliance: In some regions, utilities and regulatory bodies may require or incentivize the installation of harmonic correction equipment to comply with power quality standards.
