Indirect heating disc dryer is a drying equipment that uses a rotating heating disc to conduct efficient heating of materials. The equipment heats the materials indirectly by passing steam, hot water or heat transfer oil through the jacket and the disc, and continuously turns and stirs the materials by the rotation of the disc to improve the heat transfer efficiency. Due to the indirect heating method, the materials will not directly contact the heat source, effectively reducing dust flying and heat energy loss. It is widely used in low-temperature drying processes in industries such as sludge treatment, chemical industry, food and pharmaceutical industry.

United States market for Indirect Heating Disc Dryer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
