The global Intervertebral Fusion Device market size is predicted to grow from US$ 3044 million in 2025 to US$ 3820 million in 2031; it is expected to grow at a CAGR of 3.9% from 2025 to 2031.

Intervertebral fusion device is a medical device used in spinal surgery, mainly for treating diseases such as intervertebral disc degeneration, vertebral slippage, spinal stenosis, and spinal fractures. Its core function is to replace or repair damaged intervertebral discs with implants, restore intervertebral height and stability, promote bone fusion, thereby relieving pain and improving spinal function. These devices are mainly divided into metal materials(such as titanium alloy, cobalt chromium alloy), biodegradable materials (such as polylactic acid), ceramics, and composite materials according to their materials. According to function, they can be divided into fixed type and active type. The former emphasizes stability, while the latter retains some physiological activity.

The global market size of intervertebral fusion devices has been continuously expanding in recent years, driven mainly by population aging, technological progress, and policy support. On the one hand, the aging population has intensified, and the number of patients with degenerative spinal diseases such as lumbar disc herniation and scoliosis has surged, promoting the market growth. On the other hand, the popularization of minimally invasive surgery and the development of customized devices driven by 3D printing technology have enhanced the safety of products with biodegradable materials. In addition, the government promotes industry development through policies such as expanding medical insurance coverage and providing research and development funding support. Multinational corporations such as Johnson&Johnson, Medtronic, and Stryker dominate the global market with their

technological advantages. Local enterprises are gradually rising, such as Wedo Medical, which are gradually enhancing their competitiveness through technology introduction and R&D investment, and the trend of domestic substitution is evident. Overall, the market concentration is high, with the top five global manufacturers having a market share of over 50%, and industry consolidation is accelerating. In the next few years, 3D printed fusion devices with absorbable materials and biologically active coatings will become a research and development focus to enhance biocompatibility and surgical outcomes. The proportion of minimally invasive surgery continues to increase, and customized products meet the needs of different patients. The industrial chain is constantly upgrading, and the collaborative cooperation from raw material supply to production and sales is enhanced, promoting the improvement of localization rate and international competitiveness.
