Lateral Lumbar Interbody Fusion (LLIF) is a surgical procedure used to treat spinal conditions, particularly in the lumbar (lower back) region. The procedure involves approaching the spine from the side (lateral) rather than the traditional anterior (front) or posterior (back) approaches. The Lateral Lumbar Interbody Fusion System is a set of medical devices and instruments designed to facilitate and support this surgical technique.

Ongoing developments focus on improving the design and materials of interbody cage implants. Manufacturers are exploring new materials and designs that optimize biomechanical properties, encourage bone ingrowth, and provide better structural support.
