A lead blanket is a flexible, protective device primarily designed to shield against ionizing radiation. Constructed with lead, a dense and heavy metal known for its excellent radiation attenuation properties, it can be formed into a blanket-like structure. The lead component is often encased or embedded within a durable outer material, such as a fabric or synthetic covering, to provide structural integrity and protect the lead from damage. Lead blankets are available in various thicknesses, depending on the level of radiation protection required, and their flexibility allows them to be draped, wrapped, or positioned around objects or individuals to block or reduce the passage of radiation. They are commonly used in medical settings, like X-ray rooms, to safeguard patients and healthcare workers from unnecessary radiation exposure, as well as in industrial and nuclear applications where radiation hazards are present, serving as a crucial tool for ensuring safety and minimizing the risks associated with radiation exposure.
