The global Long Glass Fiber (LGF) Compound market size is predicted to grow from US\$ 953 million in 2025 to US\$ 1566 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

In 2025, global Long Glass Fiber (LGF) Compound reached approximately 299.7 K tons, with an average global market price of around 3,250 USD/ton.

Long Glass Fiber (LGF) Compound refers to a type of reinforced thermoplastic composite material made by uniformly embedding continuous long glass fibers (typically with a length of 10–25 mm, or even longer in some cases) into a thermoplastic matrix resin (such as PP, PA, PBT, or PPS) through specialized compounding processes like LFT-G or LFT-D. It combines the high strength, rigidity, and impact resistance of long glass fibers with the excellent processability, lightweight, and recyclability of thermoplastics, effectively overcoming the performance limitations of short glass fiber composites and serving as a key material for lightweight and high-performance structural components in various industries.

Demand for Long Glass Fiber (LGF) Compound is primarily driven by the global trend of lightweighting in the automotive industry (to reduce fuel consumption and emissions), the growing demand for high-strength and corrosion-resistant materials in the electrical and electronic sector, and the expansion of applications in construction and medical devices. Additionally, the advantages of LGF compounds in replacing traditional metal and short fiber composites further boost market needs. Business opportunities lie in the development of high-performance LGF compounds with customized resin matrices and fiber contents for specific industry requirements, the optimization of compounding processes to improve fiber length retention and mechanical properties, the expansion of

applications in emerging fields such as new energy vehicles and aerospace, and the provision of integrated solutions including material selection and processing support for downstream manufacturers.
