The global Maglev Artificial Heart market size is predicted to grow from US$ 138 million in 2025 to US$ 192 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

Maglev artificial hearts use magnetism to levitate rotors to drive a blood pump in the device instead of mechanical bearings.

With the high incidence of heart disease, effective cardiac treatment technology is needed for treatment. The magnetically levitated heart uses magnetism to levitate a rotor that drives the blood pump in the device, which minimizes friction and extends its lifespan. If this technology is mass-produced and commercialized, it will help countless people suffering from heart disease.
