The global MBE Foundry market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Molecular Beam Epitaxy, or MBE for short, is a crystal growth technology. First, the wafer to be grown is placed in an ultra-high vacuum chamber of ~10-10Torr, and the single crystal material to be grown is placed in the In the jet furnace, when the furnace temperature rises to a certain temperature, the materials in the furnace will evaporate in the form of atomic beams or molecular beams. At this time, the substrate is also heated to an appropriate temperature. When the molecular beam hits the substrate, it will Atoms on the surface of the substrate combine to grow extremely thin, which can be as thin as a single atomic layer level, a single crystal and a superlattice structure in which several substances alternate. Molecular beam epitaxy MBE equipment is used in the growth of two-dimensional materials, topological materials, and oxides. It has good performance. Such as: III-V group, II-VI group, Si SiGe, metal and metal oxide, and GaN, AlN, AlGaN, InGaN, AlGaInN, CIGS, OLED, etc. Molecular beam epitaxy MBE system needs to be in ultra It is carried out in a high-vacuum environment, and the vacuum degree is extremely high, and the vacuum degree can reach 2?10-10 torr. At the same time, the molecular pump needs to be low-vibration, low-noise, clean and oil-free to ensure the stability of the ultra-high vacuum and the crystal lattice. Probe analysis of growth and anaphase.
