The mRNA shingles vaccine is a vaccine developed using mRNA technology to prevent herpes zoster, commonly known as 'shingles'. Herpes zoster is caused by the reactivation of the varicella-zoster virus (VZV), typically manifesting as painful blisters on the skin. The mRNA shingles vaccine introduces mRNA encoding specific antigen proteins of the varicella-zoster virus into the human body, inducing human cells to produce these antigen proteins and subsequently stimulating the immune response to form long-term immune protection against the varicella-zoster virus. This vaccine offers advantages such as high efficacy, safety, and a short development cycle, providing an effective immune barrier for susceptible populations.
