mRNA vaccines for animals are a type of veterinary vaccine that use messenger RNA (mRNA) technology to stimulate an immune response against specific pathogens in livestock, pets, and other animals. These vaccines work by delivering synthetic mRNA encoding viral or bacterial antigens into the animal's cells, prompting the immune system to recognize and fight the targeted disease. Compared to traditional vaccines, mRNA vaccines offer faster development timelines, improved efficacy, and the ability to rapidly adapt to emerging animal diseases. They are being explored for various applications, including livestock diseases (such as foot-and-mouth disease), zoonotic infections, and companion animal health.
