Oncolytic Bacterial Drugs are a class of drugs that utilize specific bacteria with selective killing effects on tumor cells. These bacteria can recognize and infect tumor cells, releasing tumor-associated antigens through replication and lysis of tumor cells, thereby stimulating the body's antitumor immune response. Oncolytic Bacterial Drugs offer unique tumor targeting and immune-activating properties, providing new strategies for cancer treatment. Compared with traditional chemotherapy and radiotherapy, oncolytic bacterial drugs have lower toxicity and better tolerability, while stimulating the body's own immune system to combat tumors. In addition, oncolytic bacterial drugs can be used in combination with other treatment methods to enhance therapeutic effects and reduce side effects. Currently, several oncolytic bacterial drugs have entered clinical trial phases, demonstrating promising therapeutic prospects.
