The global Phosphite Fertilizer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Phosphite fertilizer is a phosphorus-based agricultural input derived from phosphorous acid (H_2PO_3) rather than conventional phosphate (H_2PO_4), delivering nutrients in a reduced-state form (phosphite, PO_3^{3-}) that enhances plant stress tolerance, root development, and disease resistance while serving as a fast-acting supplemental P source. The supply chain begins with upstream production of industrial phosphorous acid—typically manufactured by reacting elemental phosphorus with water or by reducing phosphate intermediates—followed by formulation stages where manufacturers blend purified phosphite salts (potassium phosphite, calcium phosphite, magnesium phosphite, etc.) into liquid or solid fertilizers with stabilizers and chelating agents. Midstream distributors, agrochemical blenders, and toll formulators package these products for crop-specific applications, after which downstream channels—farm supply retailers, cooperatives, agronomists, and large agricultural distributors—deliver them to end users in row crops, fruits, vegetables, nuts, turf, and specialty horticulture, where phosphite fertilizers are applied via foliar spray, fertigation, or soil drench for improved plant vigor and pathogen suppression. In 2024, global phosphite fertilizer output was about 1.10 million tons versus a capacity of 1.30 million tons, with an average price of USD 850–1,650 per ton and a steady gross margin of 26%, reflecting solid demand and healthy industry utilization.

United States market for Phosphite Fertilizer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Phosphite Fertilizer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
