Pneumatic cylinders are mechanical devices which use the power of compressed gas to produce a force in a reciprocating linear motion.

Pneumatic Cylinders types mainly include Single-acting cylinders (SAC) and Double-acting cylinders (DAC).

Single-acting cylinders (SAC) use the pressure imparted by compressed air to create a driving force in one direction (usually out), and a spring to return to the 'home' position. More often than not, this type of cylinder has limited extension due to the space the compressed spring takes up. Another downside to SACs is that part of the force produced by the cylinder is lost as it tries to push against the spring.

Double-acting cylinders (DAC) use the force of air to move in both extend and retract strokes. They have two ports to allow air in, one for outstroke and one for instroke. Stroke length for this design is not limited, however, the piston rod is more vulnerable to buckling and bending.

ISO, otherwise known as the International Organisation for Standardisation, is an independent body that develops common, international standards for businesses around the world to voluntarily adhere to. It works to help both consumers and businesses alike.

ISO standards are put in place to help businesses increase productivity, minimise errors and reduce waste. The aim of the standards is to support companies when entering

new markets, assisting the development of global trade on a fair basis. From a consumer point of view, ISO standards safeguard end-users, ensuring certified products conform to the minimum standards set internationally.

Pneumatic cylinders can conform to different ISO standards, depending on the specification of the product. ISO standards that relate to usability allow end-users to understand the products compatibility with mountings or accessories.
