## Abstracts

The global Prefabricated Modular Operation Theater market size is predicted to grow from US\$ 363 million in 2025 to US\$ 652 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

A Prefabricated Modular Operation Theater is a delivery-oriented surgical environment system in which key OR elements—clean enclosure interfaces (walls/ceiling/floor and sealing), clean HVAC and airflow organization, medical gases and power/ICT infrastructure, doors and viewing windows, and interfaces for surgical lights/booms and equipment—are standardized, modularized, largely factory-prefabricated, pre-assembled, and pre-inspected, then rapidly installed on site with final commissioning and validation. Its core value is replacing extensive on-site craft work with industrial manufacturing to control consistency, sealing integrity, and interface precision upfront, shorten downtime windows, reduce cross-trade contamination and rework, and improve predictability for maintenance, scaling, and upgrades. It is not merely a fit-out project, but a systems-engineered product constrained by infection control and clinical workflow, governed across design–manufacture–installation–validation. In 2025, global Prefabricated Modular Operation Theater production reached approximately 11.42 k units and price is 32.5 K USD/unit. The average gross profit margin of this product is 18%.

Growth is driven by hospitals needing both faster delivery and higher operating standards. New campuses, upgrades of existing OR suites, and phased renovations with minimal service disruption demand predictable schedules and right-first-time quality. Prefabrication shifts critical control points to factory settings, improving consistency in sealing integrity, module tolerances, and medical-gas/electrical interface precision. In parallel, infection control and operational efficiency have become hard

constraints for surgical departments; stable cleanliness performance, pressure management, and rapid recovery requirements are elevating prefabricated modular ORs from “engineering optimization” to a strategic healthcare operations infrastructure option.

Risks concentrate on system integration and validation delivery. ORs are highly coupled systems spanning architecture, MEP, clean HVAC, medical gases, digital infrastructure, and clinical equipment; unclear interfaces or insufficient design freeze can translate into rework and schedule slippage. Prefabrication does not eliminate commissioning: airflow patterns, pressure differentials, temperature/humidity stability, noise/vibration, and sealing durability still require rigorous testing and validation—failure undermines clinical go-live and stakeholder confidence. Commercially, multi-party responsibility boundaries can trigger disputes; without strong EPC capability and disciplined change control, costs can become unpredictable and delivery contentious.

Demand is moving from building single rooms to establishing replicable surgical platforms. Hospitals increasingly build standard room templates and modular libraries with unified materials, interfaces, and acceptance/validation to achieve multi-room consistency and centralized maintenance. In retrofit scenarios, “minimal downtime, zoned/phased delivery, renovate while operating” is becoming dominant, pushing higher prefabrication ratios and faster on-site assembly. Functionally, deeper integration with digital OR systems, equipment management, logistics, and energy management is driving earlier planning for embedded interfaces, cabling, and data connectivity—upgrading delivery from “space” to an integrated “space + MEP + digital-ready interfaces” system.

Upstream is dominated by cleanroom construction materials and key MEP components. Enclosure and surface systems typically include coated metal composite wall panels, ceiling modules, sealing gaskets and connectors, conductive/anti-static flooring, door systems, and viewing windows—where corrosion resistance, disinfectant tolerance, cleanability, and airtightness are critical. Clean HVAC includes filters, AHUs/fans, dampers/diffusers, ducting, and control systems that determine stable cleanliness and pressure control. Medical gases and MEP include piping, valves, alarms/interlocks, cable trays, and embedded mounts for lighting/booms—defining reliability and expandability. Material consistency, tolerance and sealing reliability, plus supply continuity and disciplined change control are foundational for assembly efficiency, validation passability, and scalable replication.
