The red blood cell survival (RBCS) is an important basic physiological indicator for basic research and clinical diagnosis, the basis for analysis of the causes of anemia, and the "gold standard" for hemolysis diagnosis. The red blood cell survival tester uses radionuclides to label red blood cells in vivo or in vitro, and observes the rate of disappearance of radioactivity in these marked red blood cells, so as to obtain the percentage of red blood cell death per day or the check point of red blood cell renewal, and the required time for 100% renewal Time is the lifespan of red blood cells. In addition, radioactive nuclides can be used to participate in erythropoiesis, and the time of radioactive disappearance in red blood cells can be measured to obtain the lifespan of red blood cells.
