Screen printing mesh, also known as silk screen mesh, is a woven fabric made from polyester, nylon, or stainless steel, specifically designed for use in the screen printing process. The mesh is tightly stretched and attached to a frame, creating a screen that acts as a stencil for transferring ink onto a substrate to create a printed image or design. Screen printing is commonly used in the textile industry for apparel printing, as well as in various other industries for printing on paper, plastics, glass, ceramics, and more. The quality and proper tensioning of the screen printing mesh play a significant role in achieving sharp and vibrant prints in the screen printing process. Screen printing mesh is divided into metal mesh and chemical fiber mesh from the weaving material. Metals are generally made of stainless steel, which has the characteristics of high tension and low elongation, but the price is very expensive, and its application is not very common. The chemical fiber screen printing mesh is generally divided into polyester material and nylon material. The difference between the two is that the polyester screen printing mesh has a low elongation rate, the mesh is less likely to be deformed, and the printing accuracy is high. The nylon material has its elasticity and can be applied to printing on non-planar materials, and it has wear-resistant characteristics.

The global Screen Printing Mesh market size is projected to grow from US\$ 750 million in 2024 to US\$ 1061 million in 2030; it is expected to grow at a CAGR of 6.0% from 2024 to 2030.
