Self-amplifying RNA vaccine, or SAM vaccine, is an innovative vaccine type based on mRNA technology. Compared with conventional mRNA vaccines, self-amplifying RNA vaccines can replicate and express antigen proteins within cells, significantly increasing antigen production and duration, and enhancing immune responses. This vaccine uses vectors such as alphaviruses to introduce mRNA encoding antigen proteins into human cells, where they replicate and express to form large amounts of antigen proteins, subsequently inducing a strong immune response in the human body. Self-amplifying RNA vaccines offer advantages such as simple production processes, easy scalability, and rapid response to viral mutations, providing a powerful tool for addressing emerging and sudden infectious diseases.
