The global Separator for Electric Double Layer Capacitor market size is predicted to grow from US\$ 68.97 million in 2025 to US\$ 142 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

In 2024, global Separator for Electric Double Layer Capacitor reached approximately 13,557.7 K Sq.m, with an average global market price of around 5.2 USD/Sq.m.

Separator for Electric Double Layer Capacitor (EDLC) is a critical porous insulating component situated between the positive and negative electrodes of EDLCs, primarily functioning to prevent electrical short circuits by physically separating the electrodes while retaining the electrolyte and facilitating unimpeded ion migration. Typically fabricated from materials such as cellulose, polyphenylene sulfide (PPS), or other synthetic fibers, it is required to possess excellent electrochemical stability (inert to electrolyte), high thermal resistance, superior electrolyte wettability, and a well-developed porous structure—properties that directly determine the EDLC's ion conductivity, internal resistance, and long-term operational reliability.

Demand for Separator for Electric Double Layer Capacitor is driven by the expanding application of EDLCs in emerging fields such as electric vehicles, renewable energy storage systems, and industrial power supplies, coupled with the growing emphasis on enhancing EDLC performance through improved power density and cycle life. Business opportunities lie in developing advanced hydrophilic modification technologies (e.g., plasma treatment) to boost electrolyte wettability and ion transport efficiency, innovating with high-performance synthetic materials to enhance thermal stability and electrochemical compatibility, optimizing porous structure designs to reduce internal resistance, and offering cost-effective, customized solutions tailored to the specialized

requirements of automotive and large-scale energy storage applications.
