## Abstracts

The global Sintered Metal Powder Filter Element market size is predicted to grow from US\$ 1513 million in 2025 to US\$ 2181 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2025, global Sintered Metal Powder Filter Element production reached approximately 36.8 million Units, with an average global market price of around US\$ 42 per unit.

A Sintered Metal Powder Filter Element is a filtration component made by sintering metal powders, such as stainless steel, bronze, or titanium, into a porous structure. This process fuses the metal particles together at high temperatures without melting them, creating a durable, permeable filter with controlled porosity. The resulting filter element is highly resistant to corrosion, heat, and pressure, making it suitable for demanding filtration applications.

The sintered metal powder filter element industry chain is a complete value chain system covering upstream raw material supply, midstream core manufacturing, and downstream application and service, with clear division of labor, strong correlation between links, and high dependence on technology and downstream demand.

The upstream segment provides core materials and production equipment for filter element manufacturing, and its quality and cost directly determine the performance and profitability of midstream products. The demand for high-end powder and equipment in upstream restricts the localization process of midstream high-end filter elements.

The midstream segment is the core link of the industry chain, focusing on the production, processing and customization of sintered metal powder filter elements, and

the competition pattern is divided into international high-end brands and domestic segmented leading enterprises. The process directly determines the product performance, and the key steps are: Raw material preparation (powder grading ? mixing) ? molding (press molding/injection molding) ? degreasing ? sintering (vacuum/atmosphere controlled sintering) ? post-processing (cutting, polishing, welding) ? precision testing ? finished product packaging.

The downstream segment covers a wide range of fields, and the demand growth of emerging industries (semiconductor, new energy, hydrogen energy) has become the core driving force for the expansion of the industry chain, while traditional industries provide stable basic demand. The demand upgrading of downstream emerging industries (semiconductor, hydrogen energy) reversely drives the technological iteration of midstream and upstream.
