The global Small Molecule Inhibitors for METex14 Skipping market size is predicted to grow from US$ 162 million in 2025 to US$ 238 million in 2031; it is expected to grow at a CAGR of 6.6% from 2025 to 2031.

MET exon 14 skipping (METex14 skipping) is a genetic alteration primarily found in non-small cell lung cancer (NSCLC) and other malignancies. This mutation leads to the skipping of exon 14 in the MET gene, preventing proper degradation of the MET receptor tyrosine kinase (RTK). As a result, the MET signaling pathway remains continuously activated, promoting tumor cell growth and metastasis. Small molecule inhibitors targeting METex14 skipping are a class of precision medicine drugs that selectively inhibit MET kinase activity, thereby blocking abnormal signaling and suppressing tumor progression. Several MET inhibitors, such as Capmatinib and Tepotinib, have been approved by the FDA for treating NSCLC patients with METex14 alterations. These drugs have demonstrated promising efficacy in clinical trials, significantly extending progression-free survival (PFS) in affected patients.

United States market for Small Molecule Inhibitors for METex14 Skipping is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
